

Just Get a Blood Test?

Biocept is using liquid biopsies to give doctors critical, timely information about cancer-with a simple blood test.

Questions for Your Doctor

1. What is the biomarker status for my tumor?

Biomarker status is important when determining appropriate treatment strategies. With a simple blood test, liquid biopsies can help determine biomarker status.

2. What are the risks of surgical biopsy?

There are times when surgical biopsy is a challenge-or even impossible. Liquid biopsies provides a new option to learn about your cancer biomarker status.

3. Is my cancer responding to treatment the way you expected?

If your treatment isn't working as expected, liquid biopsies may help determine whether your cancer has multiple abnormalities that may respond differently to different treatment options.

4. Is it possible that my cancer has changed?

Cancer can change over time, especially when it spreads or comes back after treatment. Liquid biopsies can help you and your doctor determine whether changing a treatment plan could lead to more effective results.
